**ABSTRACT**

**Background:** Elementary school-age children are very vulnerable to dental and oral problems. One of the reasons someone ignores dental and oral health problems is the lack of knowledge, attitudes and behavior about dental and oral health. One of the efforts to increase knowledge, attitudes and behavior of dental and oral health is counseling using question cards as media. **Objective:** The aim of the study was to determine the effect of counseling using question card media on knowledge, attitudes, and oral health behavior of grade V students at SDN 6 Mangkurayat Garut Regency. **Method:** This research using a research design one group pre-post test design by providing treatment, namely counseling using question card media. The research measuring tool used a questionnaire sheet of knowledge, attitudes and behavior of dental and oral health. Samples are taken using total sampling namely as many as 33 students of class V. Data analysis using test Wilcoxon on the SPSS program. **Results:** The results of the analysis using the test Wilcoxon obtained knowledge, attitudes, and dental and oral health behavior with a p-value = 0,000 ( $p < 0,05$ ). **Conclusion:** There is an influence of counseling using question card media on knowledge, attitudes, and oral health behavior of grade V students SDN 6 Mangkurayat Garut Regency.
