ABSTRACT

Dental and oral health for Indonesian people is still an important matter and requires serious attention from health workers, both dentists and dental nurses. Based on data obtained at the Siloam Hospital Kebon Jeruk Jakarta Barat Dental Clinic, many patient visits involved cases of toothache or dental caries. This study aims to analyze the relationship between patient motivation and experiences of caries at the Siloam Hospital Kebon Jeruk Jakarta Barat Dental Clinic. This type of research is analytic descriptive with a cross-sectional approach design. The population in this study consisted of 30 people, based on the average monthly number in 2025, using purposive sampling techniques according to patient criteria, which include having dental caries and being aged between 25-30 years. This study was tested using the Chi-Square test calculation. The research results found that most of the motivation for dental treatment at Siloam Hospital Kebon Jeruk West Jakarta Polyclinic was in the high category, and dental caries experience was in the very low category. Using the Chi-Square test, the p-value obtained was $0.002 < 0.05$, so H_a was accepted and H_o was rejected. The conclusion of this study is that there is a relationship between patient motivation and caries experience at Siloam Hospital Kebon Jeruk West Jakarta Polyclinic. Suggestions from the research are expected to help increase motivation to visit dental services and check their oral health in order to maintain dental and oral health.
