Dear Lia Nurcahyani,

Please make some revisions based on each of the comments on your manuscript. In addition, please fill out the Author Response Form and provide colored highlights for the revised sections.

Revision can be sent to Editor through your submission system in the Author Version and by replying to this email (in case the system is found error or under maintenance) by **May 22, 2023**, at the latest.

Please also complete the supplementary files (cover letter and statement). Hereby we attach the Submit Revision Tutorial as a submission guide.

Thank you for your kind attention and cooperation.

Regards,
Dewi Susanna

Author Response to Editors' Comment

No.	Editors' / reviewers' comment	Response to comment	Lines
1	Please adjust this section into no more than 200 words.	The number of words in the abstract is 198 words	18-33
2	Please paraphrase these sentences into general information/sentences that do not need sources	<p>The sentence has been replaced with :</p> <p>The tool used for contraceptive counseling is a decision-making tool for family planning flipchart.</p>	18-19
3	Please explain in more detail the two-stage sampling in the method section	In the first stage, from all primary health care (PHC) in Cirebon City, Indonesia (22), 11 intervention and 11 control groups were determined using random allocation. In the second stage, five respondents were taken from each PHC by simple random sampling.	26-29
4	Please change these keywords into just word/phrase, please make the keywords shorter (1-2 words)	<p>Keywords have been replaced with :</p> <p>Family Planning, Counseling, Application, Postpartum Contraceptive</p>	34
5	It will be better if you add the situation of maternal mortality rate in other developing countries. Hence, it will bring more the urgency of your topic study to be explored.	<p>These sentences have been added :</p> <p>Approximately 800 women die daily from avoidable conditions associated with pregnancy and childbirth, and 99% of all maternal mortality occurs in developing countries.¹ One of the factors causing the still high maternal mortality in Indonesia and other developing countries are being too young or old to give birth</p>	38-41
6	<p>Please add this source into the reference list.</p> <p>Based on the Indonesian Method Information Index (Family Planning Report 2020), family planning counseling quality is 30.4%</p>	<p>This source has been added to the reference list.</p> <p>Based on the Indonesian Method Information Index in Family Planning Report 2020, family planning counseling quality is 30.4% ⁶</p>	48-50

No.	Editors' / reviewers' comment	Response to comment	Lines
7	Please add more justification of why you choose Cirebon City as your place of the study	Because the percentage of unmet needs in Cirebon City exceeds the national figure of 23.02%	45-46 92-95
8	Does it refer to the source no 10 or this study?	“This research also developed “Si KB Pintar” refer to this study , source no 10 (before manuscript revision) or 13 (after manuscript revision) is the previous study	75
9	What can your study contribute to the world?	This research will reference family planning counseling media that will reduce unmet need.	83-85
10	Methods must be systematic, detailed, and complete: with subtitles ranging from research design (if any); detailed data analysis to interpretation of results; explaining everything displayed in the results; minimum sample calculation; what variables are measured and how to measure them, and the tools used	The method has been systematically organized with subtitles: design, variables, participants and minimum sample calculation, research instrument, and statistical analysis	87-166
11	It is seems unmatched if you said the population is only pregnant women when you also included the midwives as your respondent.	The population and sample only pregnant women, the midwives as enumerators	104, 113-114
12	How about the decision maker for this issues? did you include it too? Since wife sometimes is not the decision maker, so the unmet needs keep going on.	The decision-maker of contraceptive use among all respondents is a mutual agreement between the wife and husband	123-124

No.	Editors' / reviewers' comment	Response to comment	Lines
13	Please add the reference number	according to the formula by Lwanga and Lemeshow, ¹⁷	107-108
14	Please note that Kesmas only use maximum of 6 Table and/or Figure through out the manuscript.	There are five tables and Figures in this manuscript - Figure 1 - Figure 2 - Table 1 - Table 2 - Table 3	148 155 176 182 195
15	You can arrange the application screen shoot in one Figure if it is necessary to be presented here.	The application screenshots have been combined into Figure 2	155-156
16	On the sampling method, explain as follows: 1. How to choose 22 CHC 2. How do you determine whether a midwife will receive intervention or control (is simple random sampling correct? or is randomization/random allocation ?) 3. How to choose 5 respondents (explained in a consecutive manner), but what needs to be explained is how to do it consecutively?	1. Cirebon City has 22 PHCs. Therefore all PHCs are used in this study 2. The correct is : Eleven intervention groups and eleven control groups were determined using random allocation . 3. I'm sorry, but the correct to choose five respondents from each PHC by simple random sampling	110-114
17	Make sure the results section shows all the steps mentioned in the Method	The result section has shown all steps mentioned in the methods.	168-198
18	Other characteristic variables related to the use of family planning should also be analyzed, for example, education, knowledge, husband's support, etc	An analysis of potential confounding factors (age, parity, and knowledge before intervention) has been conducted. However, husband support was not analyzed as the decision to use contraception was determined based on the agreement between respondents and their husbands.	182-183 195-198

No.	Editors' / reviewers' comment	Response to comment	Lines
19	please add a p-value to assess whether the two groups are homogeneous?	<i>p-value</i> have been added. Based on the p -value $> 0,05$, indicating there are no statistically significant difference in age, parity and knowledge between the two groups, thus indicating homogeneity	174-175
20	Why do you use only 2 variables as participant's characteristic?	The knowledge variable has been added to this manuscript.	100
21	<p>To ensure the effect of the intervention, other characteristic variables related to family planning use should also be controlled for (eg age, number of children, education, knowledge of family planning, husband's support, etc.).</p> <p>To control it can be done on multivariate analysis</p>	The multivariate with logistic regression analysis has been conducted.	164-165 195-196
22	The Discussion focuses on results. If making comparisons with other research, add opinions and supporting evidence. Then mention the weaknesses and strengths of the research, the bias that occurs, explain how to minimize this bias. After that, add suggestions for further research based on the references and discussion.	The discussion has been revised and focused on the results. Opinions and supporting evidence have been added to the comparison with other studies, mentioning the strength and weaknesses of the research: biases that may have occurred and efforts made to minimize bias. Recommendations have also been included.	200-342
23	Make sure the conclusion is not the result (do not repeat what is in the results), but a summary of the discussion; Also, suggestions that came from the discussion.	The conclusion has been revised to provide a summary and suggestions based on the discussion.	344-352

No.	Editors' / reviewers' comment	Response to comment	Lines
24	<p>Please provide the DOI and URL for each references, including the government reports like Riskesdas etc.</p> <p>Please change the source no. 14 into the newest reference (2013-2023).</p>	<p>The Digital Object Identifier (DOI) and URL have been included for each reference.</p>	382-536
